List of Appendices

1. Introduction

1.1. Appointment

The Jones Consulting Group Ltd. (TJCG) was retained by Tonking Management Inc. (Client) to prepare this Preliminary Servicing and Stormwater Management Report for the proposed residential development known as St. Andrew's Lake Village. The proposed development is located in the Town of Penetanguishene (Town), and consists primarily of residential type (single detached and townhouse) development, as well as a small Commercial Block and Future Residential Block. This Report is provided to the Town in support of the required Zoning By-Law Amendment.

1.2. Property Description

The site is generally rectangular in shape; bound to the north by Pine Grove Road and existing residential dwellings, to the west by Fuller Avenue, to the east by St. Andrew's Lake, and to the south by existing rural residential and agricultural lands. The site and surrounding land uses are shown on the accompanying Zoning Map. Refer to **Appendix A**.

The properties total area is approximately 13.0 hectares (ha). The development is municipally known as 1145 Fuller Avenue, Penetanguishene, and legally described as Lots 21B, 53B, 63B, and part of Lot 77B Registered Plan 69, formerly in the Township of Tay, now in the Town of Penetanguishene, County of Simcoe. The location of the subject property is shown overleaf in **Figure 1**.

The development lands are mainly vegetated with a combination of pasture and forest type land cover. A portion of the site is also grassed, surrounding the existing residential dwelling and barn. Wetland vegetation is also present along the eastern development limit within the proposed EP Block adjacent to St. Andrew's Lake.

In general, the existing topography is considered gently sloping and drains in an easterly direction (towards St. Andrew's Lake) at an average gradient between 2 and 6%. Along the southern development limit the topography is more steeply sloped. This area drains north easterly at slopes ranging from 10 to 15%. Topographic survey information for the site was complete by others with additional topographic survey and field truthing completed by TJCG.

A Geotechnical Investigation of the subject lands was undertaken by Geospec Engineering Ltd., in 2006. Their fieldwork program included five (5) boreholes ranging in depth from 6.5m to 11.1m below existing ground. The boreholes generally encountered a layer of organic topsoil/peat over a layer of sand, silt and sand, and sand and silt till which extended beyond the final depths of investigation. The density of founding soil generally varied from compact to very dense and no groundwater was encountered during drilling. A copy of the Geotechnical Report can be found under separate cover. Refer to "Geotechnical Investigation, St. Andrew's Village, Penetanguishene, Ontario" dated January 16, 2006. Based on the Soil Survey of Simcoe County Report No. 29, the soils on site are represented by the Tioga Loamy Sand soil series, which corresponds to hydrologic soil group A.

Figure 1: Site Location Plan

1.3. Proposed Land Use

The latest St. Andrew's Lake Village Site Plan prepared by Innovative Planning Solutions indicates that the property will be subdivided into various sized residential lots and blocks (single detached and Townhouse), a commercial block, future residential block, parkland block, open space block, stormwater management blocks, and an environmental protection block. The Site's proposed land use statistics are summarized in **Table 1,** below. Refer to the Site Plan attached in **Appendix A** for the location and orientation of the lots, blocks and streets/Lanes.

Table 1: St. Andrews Lake Village - Site Plan Land Use Statistics

Residential Lot Breakdown	**Area (ha)**	**Units**
40ft Singles	1.662	38
35ft Singles	1.532	50
30ft Singles	1.013	38
20ft Street Townhomes	0.785	47
Sub-Total	**4.992**	**173**
Other Block Breakdown		
Future Residential Block	0.228	30 (estimated)
Neighborhood Commercial Block	0.227	N/A
Stormwater Management Block	0.675	N/A
Parkland Block	0.100	N/A
Open Space Block	0.140	N/A
Environmental Protection Block	5.612	N/A
Streets/Lanes and Parking	1.064	N/A
Sub-Total	**8.046**	**30**
Total	**13.038**	**203**

The proposed development will be serviced with privately owned sanitary and water infrastructure that connects to existing municipal infrastructure. In addition, privately owned storm sewer infrastructure, Low Impact Development (LID) systems and SWM facilities will be employed to convey drainage and provide the required levels of quality and quantity control of stormwater run-off.

Due to the narrow nature of the proposed streets/laneways (7.4m wide), 3.0m easements will be provided on both sides of the internal roads to accommodate water servicing and utility infrastructure. Two (2) site accesses are proposed to connect the internal roadways to the existing municipal right-of-ways. The first access/egress is to Fuller Drive and the second access/egress is to Pine Grove Road.

2. Supporting Documents

The following documents have been referenced in the preparation of this report:

- Town of Penetanguishene Land Development Engineering Policy, April 2009;
- Ministry of the Environment, Design Guidelines for Sewage Works, 2008
- Ministry of the Environment, Design Guidelines for Drinking-Water Systems, 2008
- Ministry of the Environment, Stormwater Management Planning and Design Manual, March 2003;
- Severn Sound Environmental Association, Urban Stormwater Management Strategy, 1998;
- Ontario Regulation 350/06, Ontario Building Code;
- Soils Map of Simcoe County, Ontario, Soil Survey Report No. 29
- Town of Penetanguishene Zoning Schedule "A"

3. Sanitary Servicing

3.1. Overview

The Town of Penetanguishene's Fox Street Sewage Treatment Plant (STP) serves the area where the development is situated. Sewage conveyance to the Fox Street STP is proposed via the existing sanitary sewers on Sheffcote Road and Cambridge Street, located in close proximity to the proposed development. Based on discussion with the Town, it is understood that sufficient treatment capacity is available at the Fox Street STP. The Town has confirmed that they are not aware of downstream sewer capacity concerns.

The proposed sanitary servicing is detailed on Drawings SAN-1 and SAN-2. Refer to **Appendix D**. Internally, sewage flows will be collected via proposed 200mm diameter PVC SDR35 sanitary mains and a series of 1200mm diameter maintenance holes to facilitate bends, appropriate clean out lengths, etc. Each proposed residential dwelling unit will be serviced with individual 100mm diameter PVC SDR28 service laterals that connect to the internal sanitary main. The Future Residential Block and Commercial Block are each proposed to be serviced via individual 200mm diameter PVC SDR35 mains.

Due to grading constraints the sanitary drainage associated with the development lands are separated north and south. The majority of the internal sanitary flows are proposed to be

conveyed via gravity sewer to the proposed Sanitary Pumping Station (SPS) centrally located within the development's Open Space Block. The sanitary flows are pumped southwest, within the development right-of-ways, from the SPS to the existing gravity sanitary sewer located at the intersection of Cambridge Street and Fuller Avenue via a 125mm diameter HDPE DR11 forcemain. The design of the SPS and forcemain has been completed by Gerrits Engineering Limited. A copy of their Design Brief is included in **Appendix B** for reference. It is noted that at this preliminary design stage the SPS is designed to accommodate a peak flow of 12.05l/s, which exceeds the currently proposed peak flow (11.39l/s) to the SPS. This surplus capacity would allow for additional peak flows to the SPS should adjustments to the proposed zoning be required.

A small northern portion of the development lands is proposed to drain via gravity sewers with Pine Grove Road; ultimately connecting to the existing sanitary sewer on Sheffcote Street immediately west of Fuller Ave. Drainage form the proposed development to Sheffcote Street is limited to ten (10) single residential lots fronting Street "C", and the future Neighbourhood Commercial Block fronting Pine Grove Road.

3.2. Sanitary Service Design Flows

For proposed residential development, the analytical sanitary forecast is determined based on estimated population. In order to determine population each residential building type is assigned a number of Persons Per Unit (PPU). The following PPU's have been assigned to the proposed building types:

Single Family Residential = 3.13 PPU

Townhouse Unit = 2.34 PPU

Future MD Residential = 1.67 PPU

With the above PPU's the estimated population of the development is determined to be 556 people (126 Units x 3.13 PPU + 47 Units x 2.34 PPU + 30 Units x 1.67 PPU). The estimated sanitary flow for commercial development is based on the Ministry of Environment Design Guidelines for Sewage works and corresponds to a peak flow of 28m^3/day/Ha or 0.32L/s/Ha. The total sanitary flow for the development can therefore be calculated with the following formula.

$$Qd = Qpd + Qpcom + Qi = \left[\frac{PQM}{86400}\right] + [Qcom \times Acom] + [I \times Ares]$$

Where: Qd = Total peak sewage flow (L/s)

Qpd = Peak domestic sewage flow (L/s)

Qpcom = Peak commercial sewage flow (L/s)

Qi = Extraneous sewage flow (L/s)

P = Design population (556 people)

Q = Average daily flow (450 L/person/day)

Acom = Area of commercial development (0.227Ha)

Qcom = Minimum peak commercial sewage flow (0.32L/s/Ha)

Ares = Area of Residential Development (6.32Ha)

I = Units of extraneous flow (0.10 L/s/Ha)

M = Harmon Peaking Factor; $1 + \left[\frac{14}{\left[\left(\frac{P}{1000}\right)^{0.5}+4\right]}\right]$ (2.0<M<4.0)

Therefore: $M = 1 + \left[\frac{14}{\left[\left(\frac{556}{1000}\right)^{0.5}+4\right]}\right]$

M = 3.95

$$Qd = \left[\frac{556\times450\times3.95}{86400}\right] + [0.32 \times 0.227] + [0.1 \times 6.32]$$

Qd = 12.14 L/s ← total peak sewage flow

In order to confirm the proposed sanitary infrastructure within the development lands has been appropriately sized a sanitary sewer design sheet has been completed. Refer to **Appendix B**. The design sheet demonstrates that the proposed sewers have been appropriately sized to convey the required flows, in addition to meeting the minimum (0.6m/s) and maximum (3.0m/s) velocity requirements stipulated by the Ministry of Environment.

Furthermore, in order to demonstrate sufficient downstream capacity at the connection points, external sanitary design sheets have been created to confirm peak flows can be accommodated at the Sheffcote Street connection point, through the Church Street Meadows Subdivision to Church Street, as well as at the Cambridge Street connection and immediate downstream sewers within Cambridge Street. Refer to **Appendix B** for supporting calculations.

Existing sanitary sewer design sheets were not available for the Sheffcote Street subdivision nor the Cambridge Street sewer. Therefore, the as recorded Sanitary Drainage Plan for the Church Street Meadows subdivision was utilized to recreate the existing subdivision design sheet, and the Town's

Web Map, Zoning Map, and existing sewer profile drawings were utilized in assessing the Cambridge Street sewer capacity. Refer to **Appendix B** for supporting documentation.

4. Water Servicing and Distribution

4.1. Overview

Based on record information provided by the Town, an existing 250mm diameter watermain is located along Fuller Avenue fronting the development lands. In addition, an existing 150mm diameter watermain is located along the north side of Pine Grove Road adjacent to Site.

The proposed domestic and fire water servicing is detailed on drawing GS-1and GS-2, **Appendix D**. In order to provide a fully looped water distribution system, two (2) connections to the existing water system is proposed. The first connection will be to the existing 250mm diameter watermain on Fuller Avenue and the second connection will be to the existing 150mm diameter watermain on Pine Grove Road. These connections will coincide with the Site entrance locations. As the proposed watermain will be privately owned, backflow prevention chambers will be provided at each of the connections to prevent potential contamination between the private water system and municipal water system. Internally, the development will be serviced with 150mm diameter PVC Class 150 watermain. A 50mm diameter loop (connected to the 150mm diameter main) will be provided at the Street D cul-de-sac to help improve water quality issues associated with dead-end watermains. A 19mm diameter (PE or Copper) domestic water service will be provided to each of the proposed single family dwellings and townhouse units. The Future Residential Block and Commercial Block will be serviced with 100mm diameter PVC Class 150 domestic water services and a 150mm diameter PVC Class 150 fire water services that will be stubbed within the respective Blocks. The Future Residential Block will be serviced from the development's internal watermain, and the Commercial Block will be serviced directly from the existing watermain on Pine Grove Road. Fire hydrants will be provided and strategically located within the development to meet Ontario Building Code (OBC) requirements for Fire Department suppression coverage.

4.2. Domestic Water Design Flows

Similar to Section 3.2, the Average Daily Flow (ADF) is determined by combining the anticipated residential flows and commercial flows for the development. Based on the estimated population of 556 people the residential ADF is determined to be 250,200L/day or 2.896L/s (556 people x 450 L/day/person). The commercial demand is based from the Ministry of Environment Design Guidelines for Sewage works and corresponds to a peak flow of 0.073L/s (0.32L/s/Ha x 0.227Ha).

Therefore the total ADF for the development can be calculated to be 2.97L/s. In order to determine the appropriate water distribution design flows for the Maximum Daily Demand (MDD) and Peak Hour Demand (PHD), the ADF is multiplied by the Ministry of Environment standard peaking factors. Refer to Table 3-1, Design Guidelines for Drinking-Water Systems 2008 prepared by the Ministry of Environment. The peaking factors and corresponding flows are summarized below:

Maximum Daily Demand Factor: 2.75

Maximum Daily Demand: 2.97L/s x 2.75 = 8.17L/s

Peak Hourly Demand Factor: 4.13

Peak Hourly Demand: 2.97L/s x 4.13 = 12.27 L/s

Based on the determined flows above and discussion with Town technical staff, it is anticipated that the Town's overall water supply has sufficient pressure and capacity to provide the required flows to the development. A Water System Analysis (WSA) will be completed at the detailed design stage to confirm watermain sizing and ensure adequate supply for potable use and fire protection is achieved for this development.

5. Stormwater Management Plan

5.1. Overview

The eastern limit of the proposed development encompasses what is known as St. Andrew's Lake Wetland. This wetland is currently the main receptacle for storm drainage from the development lands and ultimately drains to St. Andrew's Lake. The storm drainage system will be designed in accordance with the Town of Penetanguishene Land Development Engineering Policy, the Severn Sound Remedial Action Plan – Urban Stormwater Management Strategy and the Ministry of Environment Policies and Guidelines. Specifically, the following criteria will be utilized:

- Minor system (storm sewers) will be sized to convey runoff up to the 5 year storm event;
- Major system (overland flow) will be designed to safely convey regulatory event run-off to the designated outlets;
- Quantity control of stormwater runoff will be provided to reduce post development peak flows to corresponding pre development flows for the 2 to 100 year storm events;

- Quality control of stormwater run-off will be provided in accordance with the "Enhanced" level of protection stipulated by the Ministry of Environment; and,
- Maintain existing annual water balance characteristics by promoting infiltration to counteract the increase in hard surfaces.

5.2. Pre and Post Development Drainage

The existing or pre development condition of the Site was determined through topographic field survey and field reconnaissance. The development lands predominately drain in an easterly direction towards St. Andrew's Lake, with a small portion of the Site draining to Fuller Avenue. The pre development catchments are outlined on drawing SWM-1, refer to **Appendix D**. Pre development catchments 101 to 104 drain easterly to St. Andrew's Lake and catchment 105 drains westerly to Fuller Avenue.

The modelled pre development hydrologic catchment properties are summarized below in **Table 2**. The catchment properties are derived from the MTO Drainage Management Manual, and are based on the existing mixture of pasture and forest type ground cover, present on-site. As previously noted, the underlying soil is Tioga Loamy Sand, corresponding to the type 'A' hydrologic soil group. Catchment coefficients i.e. CN and Rational 'C' are based on the weighted mean of land cover over the determined soil group. Supporting catchment property calculations are provided in **Appendix C**.

Table 2: Pre Development Catchment Properties.

Catchment	Area (ha)	Curve Number	Pervious Curve Number	Rational Coefficient	Impervious Fraction (%)	Initial Abstraction (mm)	Time of Concentration (hrs)
101	2.264	37	35	0.14	1.77	8.86	0.37
102	0.905	32	32	0.08	0.00	10.00	0.18
103	4.021	35	35	0.08	0.00	9.05	0.59
104	1.177	32	32	0.08	0.00	10.00	0.24
105	0.252	41	41	0.09	0.00	7.50	0.31

The post development drainage conditions are derived from the proposed servicing and grading plans accompanying this Report. Refer to Drawings, SS-1, SS-2, LG-1 and LG-2, **Appendix D**. In order to meet the required quality and quantity control targets outlined in Section 5.1 of this Report, a combination of OGS units, dry ponds and rain gardens will be employed. The post development condition has been broken down into six (6) catchments. Refer to drawing SWM-2, **Appendix D**.

Catchment areas 201 and 203, represent the bulk of development and drain to the proposed south and north OGS unit and dry pond facility, respectively. These catchments ultimately drain easterly to St. Andrew's Lake post quality and quantity control.

Catchment area 202, represents uncontrolled areas that due to grading constraints, are not directed to the proposed SWM Facilities. This catchment drains easterly to St. Andrew's Lake and largely includes the rear lots and blocks adjacent to the proposed EP Block. It is important to recognize that the modelling has been completed based on the assumption that the proposed rear roof leaders of the houses in this catchment will be directed to the front of each lot.

Catchment 204 represents the rear lots of the development that drain west to Fuller Avenue. Due to grading constraints, this catchment could not be directed to the proposed SWM Facilities, as such, a linear rain garden is proposed along the rear yards of this catchment to provide quantity control of storm run-off to Fuller Avenue.

Catchment 205 represents a small area of the development that drains north to Pine Grove Road. In order to provide quantity control for this catchment, a rain garden is proposed along the flankages of Lot 1 and 173, as well as along the rear of lots 1 to 5, adjacent to the commercial block.

Catchment 206 represents the proposed commercial block. As the current development plan for the commercial block is unknown at this time, it is anticipated that this block will provide its own on-site quality and quantity control of storm run-off. This has been accounted for in the Development's overall stormwater design and allowable peak post development storm discharge rates have been assigned to this block. Refer to Drawing SWM-2, **Appendix D**. The required on-site stormwater quality and quantity control features for the commercial block are to be determined based on the development proposal and incorporated into the development layout at the Site Plan Control stage.

The post development properties of catchments 201 to 206 are summarized in **Table 3**. Catchment coefficients i.e. CN and Rational 'C' are based on the weighted mean of land cover over the determined soil group. Supporting catchment property calculations are provided in **Appendix C**.

Table 3: Post Development Catchment Properties.

Catchment	Area (ha)	Curve Number	Pervious Curve Number	Rational Coefficient	Impervious Fraction (%)	Initial Abstraction (mm)	Time of Concentration (hrs)
201	2.737	82	49	0.65	65	3.05	0.155
202	2.314	42	40	0.11	3	7.36	0.275
203	2.475	82	49	0.65	65	3.05	0.319
204	0.625	64	49	0.35	30	4.10	0.089
205	0.240	82	49	0.65	65	3.05	0.057
206*	0.228	TBD	TBD	TBD	TBD	TBD	TBD

*Note: Catchment 206 to provide on-site stormwater quality and quantity control to meet allowable peak flow targets. Required stormwater management infrastructure will be determined at Site Plan Control stage.

Modeling of pre and post development catchments was undertaken using Visual Otthymo 3.0 software. The 4-hour Chicago Storm Distribution and 24-hour SCS Type II Distribution were used to generate design storms based on the Orillia rain gauge in accordance with Town Standards. Event modeling design storms included the 25mm and 2 to 100-year 4-hour Chicago Storms, 2 to 100-year 24-hour SCS storms as well as the Regional (Timmins) storm. Detailed Visual Otthymo Outputs are provided in **Appendix C**. **Table 4** summarizes the determined pre and post development peak flow drainage patterns at the east and west outlets.

5.3. Stormwater Quality Control

In terms of the quality control requirements for stormwater run-off, the "Enhanced" level of protection as stipulated by the Ministry of Environment is to be provided. i.e. 80% removal of Total Suspended Solids (TSS). Furthermore, erosion control is required to ensure that the 25mm post development peak flow is released over a 24-hour period. These requirements are achieved through the proposed stormwater treatment train approach.

Catchment areas 201 and 203 encompass the vast majority of the development and its associated impervious surfaces requiring quality treatment. These catchments drain through a series of catchbasins and storm sewers that direct run-off to proposed OGS units, prior to outletting to the respective dry ponds. The OGS units have been sized with the PCSWMM for Stormceptor software using the Orillia rain gauge (Station ID # 5820). A Stormceptor Model STC 6000 is proposed to service catchment 201. This unit achieves the water quality objective by removing 80% TSS for a Fine (organics, silts and sand) particle distribution, treating 94% of the average annual run-off. A Stormceptor Model STC 6000 is also proposed to service catchment 203. This unit provides 81% TSS removal for a fine (organics, silts and sand) particle distribution, treating 95% of the average annual run-off. Refer to **Appendix C** for detailed Stormceptor Design Reports.

In addition to the quality treatment provided by the OGS units, further quality treatment is provided by the downstream dry ponds. Both the South and North dry ponds utilize a Hickenbottom style riser with a 50mm diameter orifice plate to provide 32.8 hour and 38.0 hour extended detention of the 25mm 4-hour Chicago event, respectively. This extended detention further enhances removal of TSS, while providing the required erosion control volume retention on-site. The drawdown characteristics of the proposed dry ponds are derived from Equation 4.1 of the Ministry of Environment Stormwater Management Planning and Design Manual. Refer to **Appendix C** for supporting drawdown calculations.

5.4. Stormwater Quantity Control

The proposed South and North dry pond facilities, as well as the proposed linear rain gardens, provide the necessary stormwater quantity control for the development. The dry pond facilities have been designed to attenuate post development event run-off for storm events up to and including the 100-year event. The dry ponds capture run-off from the main development area (catchments 201 and 203) ensuring post development flows to the East are controlled to corresponding pre development peak flows.

The proposed rain gardens will be employed to control peak flows from the small catchment areas that drain to Fuller Avenue and Pine Grove Road, catchments 204 and 205, respectively. As previously noted, these catchments were unable to drain to the proposed OGS units and dry ponds due to grading constraints. The rain gardens have been designed to allow the 100-year event from these catchments to be attenuated and infiltrated into the ground.

The proposed southern dry pond (SWMF #1) has a bottom elevation of 225.90m and a minimum top elevation of 228.20m. Flow control is provided through a Hickenbottom style riser, and a 50mm diameter orifice plate at an invert elevation of 225.90m. The dry pond facility has been graded with 4:1 internal side slopes, and 3:1 external side slopes have been used to match into the existing and proposed ground surrounding the facility. A 3.5m wide access road is provided along the east side of the dry pond to facilitate any required maintenance procedures. In the event of a blockage to the dry pond outlet, a 2.0m wide emergency overflow weir is provided at an elevation of 227.65m. The overflow weir has been sized to allow the uncontrolled regulatory peak flow to be conveyed through the dry pond while maintaining a minimum 0.3m freeboard. The maximum ponding elevation in this pond is 227.55m, which occurs during the 24-hour 100-year SCS storm.

The proposed northern dry pond (SWM Facility #2) has a bottom elevation of 225.80m and a minimum top elevation of 228.10m. Flow control is provided through a Hickenbottom style riser

and a 50mm diameter orifice plate at an invert elevation of 225.80m. Similar to the southern dry pond facility, the northern facility has been graded with 4:1 internal side slopes, and 3:1 external side slopes. A 3.5m wide access road is provided around the entire dry pond to facilitate any required maintenance procedures. In the event of a blockage to the dry pond outlet, a 2.0m wide emergency overflow weir is provided at an elevation of 227.50m. The overflow weir has been sized to allow the uncontrolled regulatory peak flow to be conveyed through the dry pond while maintaining a minimum 0.3m freeboard. The maximum ponding elevation in this pond is 227.22m, which occurs during the 24-hour 100-year SCS storm.

The Fuller Avenue rain garden is located along the rear of lots 10 to 58, adjacent to the Fuller Avenue Right-of-Way. The proposed rain garden will be comprised of 1.0m wide x 1.3m deep 50mm diameter clearstone wrapped in non-woven geotextile. A layer of 100mm diameter river stone 200mm thick (underlain with non-woven geotextile), will be placed on top of the clearstone trench. Refer to Typical Rain Garden Detail on drawing STM-1 and STM-2, **Appendix D**. The total length of this rain garden is 340m corresponding to a total volume of approximately 176m^3. (176.8 = 340m x 1.0m x 1.3m x 0.4 (void ratio)). The maximum required storage occurs during the 100-year 24-hour SCS and corresponds to a volume of 174m^3.

The Pine Grove Road rain garden is located along the flankages of lot 1 and lot 173, adjacent to Pine Grove Road, as well as the rear of lots 1 to 5. The proposed rain garden will be comprised of 2.0m wide x 2.0m deep 50mm diameter clearstone wrapped in non-woven geotextile. A layer of 100mm diameter river stone 200mm thick (underlain with non-woven geotextile), will be placed on top of the clearstone trench. Refer to Typical Rain Garden Detail on drawing STM-1 and STM-2, **Appendix D**. The total length of this rain garden is 95m corresponding to a total volume of approximately 152m^3. (152 = 95m x 2.0m x 2.0m x 0.4 (void ratio)). The maximum required storage occurs during the 100-year 24-hour SCS and corresponds to a volume of 140m^3.

The proposed commercial block's development plan is unknown at this time. In order to meet pre development flows to the west, the commercial block will be required to provide on-site stormwater quality and quantity control. The allowable post development peak flows for the commercial block are outlined in **Table 4**. Details for the proposed commercial block's stormwater management infrastructure are to be determined at the Site Plan Control Stage.

Modelling of the quantity control features was completed using Visual Otthymo 3.0 and the Route Reservoir routine. The determined pre and post development flows to the East and West, as well as the event storage conditions for each quantity control feature are outlined in **Table 4**. Supporting Visual Otthymo outputs and stage, storage and discharge calculations for the Dry Ponds are included in **Appendix C** for reference.

Table 4: Pre Development, Post Development and Stormwater Management Facility Operations Summary

Storm Event	Pre Development		Post Development		South SWM Facility		North SWM Facility		Fuller Avenue Rain Garden	Pine Grove Rain Garden
	Peak Flow (Uncontrolled)		Peak Flow (Controlled)		Storage Volume	Elevation	Storage Volume	Elevation	Storage Volume	Storage Volume
	West Outlet	East Outlet	*West Outlet	East Outlet

*West Outlet Post Development Peak Flows represent the allowable peak flows for the Commercial Block in the post development condition.

5.5. Minor and Major Stormwater Conveyance

In terms of minor event conveyance (i.e. storm events less than or equal to the 5-year event) run-off will discharge to the proposed OGS and Dry Pond facilities via the proposed storm sewer network. Refer to drawings STM-1 and STM-2, **Appendix D**. Supporting storm sewer sizing calculations are provided in **Appendix C**. During major storm events (storm events greater than the 5-year event) or in the event that a blockage to the storm sewer network was to occur, site grading has been completed to safely direct flows to the proposed dry ponds without causing flooding to the proposed buildings or adjacent properties. The post development overland flow route is shown on drawing STM-1 and STM-2, **Appendix D**.

Two (2) existing external drainage catchments drain through the subject lands in the pre development condition. The first external catchment is located along the south property boundary. Flows from this catchment will be diverted around the subject lands via a proposed swale/berm. The second external catchment is located along the north property boundary. Flows from this catchment will also be diverted via proposed swales and a separate storm sewer network. Flows from these external catchments will be uncontrolled and will not contribute flow in the post development condition.

5.6. Water Balance

A pre to post development water balance has been undertaken for the site. The analysis has been completed using the Hydrologic Cycle Component Values from Table 3.1 of the Ministry of Environment Stormwater Management Planning and Design Manual, dated March 2003. Supporting calculations are provided in **Appendix C**. The completed analysis does not include the proposed commercial block as it is anticipated that this block will complete its own water balance at the Site Plan Control Stage.

In the pre development condition, the average annual infiltration has been determined to be approximately 220.5mm. Based on the pervious area of the development (8.351Ha), this corresponds to an annual average infiltration volume of 18,414m^3. In the post development condition the average annual infiltration has been determined to be 193.2mm. The pervious area in the post development condition has been determined to be 4.598Ha corresponding to an average annual infiltration volume of 8,883m^3. This corresponds to a net loss of approximately 9,531m^3 of infiltration between the pre development and post development condition.

In order to acheive the required water balance, a clearstone layer below the northern dry pond facility will be utilized to promote infiltration in the post development condition. The clearstone

layer has an area of approximately 532m^2 and will be 0.5m thick. Based on a porosity of 0.40 for the clearstone the total volume of storage is 106.4m^3. The total drainage area to the norther dry pond is 2.475Ha (Refer to Catchment 203). Climate data indicates that an average of 99 rain events occur each year (excluding December, January and February), and that the average precipitation during an event is 4.8mm. The average rainfall event corresponds to a volume of 118.8m^3 (2.475Ha x 4.8mm). This is greater than the volume of storage provided in the clearstone layer below the dry pond facility. Depending on the duration between storm events it is expected that 10,534m^3 (106.4m^3 x 99 events) could potentially infiltrate into the ground below the dry pond facility. This additional infiltration volume is more than the net loss of infiltration between the pre and post development condition. In addition, further infiltration will be provided by the proposed rain gardens, however, this volume of infiltration has not been included in the assessment in order to add further conservatism to the preliminary design. Based on the above, it is evident that the proposed stormwater management plan achieves the required water balance, in turn promoting groundwater recharge in this area of the watershed.

6. Erosion and Sediment Control

During construction, the majority of the development's natural features will be removed and the topsoil stripped within the development area. The exposed surface will be susceptible to erosion, increasing the potential for sediment runoff. To minimize local and downstream impacts from erosion and sedimentation during construction, the following measures have been recommended:

- Excess earth and topsoil is to be stockpiled away from environmentally sensitive areas and/or removed from site. Stockpiles shall be seeded or covered with erosion control if left for periods of greater than 30 days.
- Temporary sediment control fencing should be erected around the perimeter of all grading activities;
- Temporary sediment traps should be installed on catch basins until surface cover has been stabilized;
- Temporary rock flow check dams should be installed within drainage cut-off swales;
- A temporary construction access mud mat should be installed at the construction accesses to reduce the amount of materials that may be transported off site;

- Temporary sediment and erosion control ponds should be installed to attenuate and treat sediment laden runoff during earthworks operations.
- Construction during drier months should be monitored for wind-borne transport of sediments. At the direction of the engineer, the contractor may be directed to water down exposed earth areas with an aqueous solution of calcium chloride or suitable alternative;
- All disturbed areas not under immediate construction for 30 days, or not intended for building activities within a 3-month time period, should be stabilized with hydro-seeding.

A detailed Erosion and Sediment Control Plan (ESC Plan) will be prepared and submitted at the detailed design stage to identify the location and details of the temporary devices.

7. Secondary Utilities

All secondary utility services will be co-coordinated and a Composite Utility Plan provided to indicate all underground locations once feedback from each utility company is provided. Electrical, Telephone/Cable are all available within the adjacent Right of Ways. At this time we do not foresee any limitations in servicing the development with secondary utilities; however, formal confirmation from each service provider is still required.

8. Conclusion

The St. Andrew's Lake Village development has been fully examined for serviceability in this Report. The development lands can be appropriately serviced via the proposed private and municipal sanitary, water and storm infrastructure. Through proper execution of the preliminary site servicing described herein and on the accompanying drawings, it is evident that the proposed development can become a functional part of the Town of Penetanguishene.

This Preliminary Servicing & Stormwater Management Report is respectfully submitted,

THE JONES CONSULTING GROUP LTD.

SEWAGE PUMPING STATION
ST. ANDREWS LAKE VILLAGE

1 Introduction

The purpose of this Design Brief is to provide preliminary design information for the proposed municipal infrastructure required to service the St. Andrews Lake Village in the Town Penetanguishene. This Design Brief covers the sewage pump station located within the proposed Development together with related sewage forcemains.

The Sewage Pump Station will include the following:

- A wet well type station
- Inlet sanitary sewer and Outlet Forcemain
- Submersible pumps (2) complete with suction and discharge piping
- An exterior control panel to house controls
- Lifting Davit for Pump Maintenance
- Internal Aluminum Access Platform
- Emergency Overflow

2 Design Criteria

A summary of the wastewater design criteria is as follows:

Wastewater Criteria

Average Daily Flow (ADF) - Residential	=	450 L/cap/d
Peak Extraneous Flows (per developable ha)	=	0.10 L/s/ha
Peak Factor (Residential and Commercial		Harmon

Residential Unit Density		=	3.13 ppu
Townhouse Unit Density		=	2.34 ppu
Future MD		=	1.67 ppu
Detatched Unit Population	= 126 Units x 3.13ppu	=	395 pers
Townhouse Unit Polulation	= 47 Units x 2.34ppu	=	110 pers
Future MD Unit Population	= 30 Units x 1.67ppu	=	51 pers
Total equivalent Population of Development		=	556 pers

3 Wastewater Flows

The Design Analysis of the Sewage Pumping Station has been completed per the Town and MOE design guidelines based on the criteria outlined in Section 2.

Wastewater flows generated from the full buildout of the Development are calculated as follows:

- ADF Domestic = 556 pers x 450 L/cap/d = 2.90 L/s
- Peak Extraneous Flow = 0.10 L/s/ha x 6.14ha = 0.614 L/s
- PF = 2.90 L/s x Harmon (3.95 for population of 566 persons) = 11.44 L/s
- Total Peak Flow = 11.44 L/s + 0.614 L/s = 12.05 L/s

Based on the above calculations, the proposed Sewage Pumping Station and forcemain have been preliminarily sized for a Peak Inflow of 12.05 L/s.

4 Wastewater Pumping Station

4.1 General

The Sanitary Sewage Pump Station with a rated capacity of 12.6 L/s is to be located within the Multi-Density Residential Block and will service the proposed residential and commercial development.

The Sewage Pump Station will be a wet well type facility. The station will consist of a pre-cast maintenance hole structure and be sized in order to provide sufficient pump cycle time. The anticipated ground elevation at the site of the Pump Station is approximately 230.25 m, and the proposed elevation of the base of the chamber is 221.79 m. The depth, therefore, of this proposed pump station is 8.46 m plus the thickness of the chamber base. The approximate invert of the sanitary sewer pipe is at 223.74 as it enters the pump station. The diameter of this sanitary sewer pipe is anticipated to be 200 mm. The station has been designed to operate with two (2) pumps designed to pump sewage through one (1) 125mm diameter forcemain connecting to the existing sanitary maintenance hole at the intersection of Cambridge Street and Fuller Ave.

4.2 Sewage Pump Station Maintenance Hole

4.2.1 Access

It is proposed that one (1) 1050 mm x 800 mm aluminum hatch in the concrete lid of the maintenance hole be provided to allow access to the structure. Two additional aluminum hatches will be provided for pump maintenance. The aluminum hatches will be equipped with an appropriate lock and a pry lip.

4.2.1.1 Wet Well Sizing

The calculation to determine the volume required is as follows:

- Phase 3 Peak Flow = 12.05 L/s
- Pump capacity based on pump and system curves will be 25.2 L/s or the differential between inflow of pumping of 50% of the pump flow = 12.6 L/s
- Assumed pump run time of 8 minutes
- Volume Required = 0.01205 m^3/s x 60 x 8.00 = 5.78 m^3
- Wet Well Design (3000mm diameter MH) = π x (1.5^2) = 7.07 m^2 surface area
- The invert of the sewer entering the wet well will be 223.74 m. The range for start to stop for Pumps 1 & 2 will be 0.9m and 1.35m respectively.
- Operating limits Start 222.99m to Stop 222.09 m of 0.90 m
- Volume Available – 7.07 x 0.9 = 6.4 m^3 which is greater than the required volume of 5.78 m^3.

4.2.2 Level Control

Ultrasonic level detection devices are proposed as the primary level detection and pump control system. Float switches will be provided as back-up.

Key Elevations are listed as follows:

Pump #1 & 2 OFF (m)	222.09
Pump #1 ON, Pump #2 OFF (m)	222.99
Pump #2 ON (m)	223.44
High Water Alarm (m)	223.59
Emergency Outlet (m)	224.15

4.2.3 Pump/System Curve

Variable frequency drives (VFDs) will be provided on both pumps to allow a range of flows to be pumped.

Three system conditions have been analyzed to produce the pump/system curve.

Condition 1 - Smooth force main piping with high sewage level

Condition 2 - med. roughness force main piping with med. sewage level

Condition 3 - higher roughness force main piping with lower sewage level

A copy of the system curve is included in Appendix “A”. The duty point is 12.6 L/s per pump at 13.1 m TDH based on the 125 mm forcemain. All the pumps will have VFD drives to accommodate the variation in flows during the build out of the residential area. Pump run-times can be optimized in the initial stages of the Development at the control panel location exterior to the structure and to ensure the minimum scouring velocity in the forcemain is 0.80 m/s.

4.2.4 Pump Selection

To accommodate the design peak flow of 12.05 L/s at 13.1m TDH, two (2) Flygt Model DP 3102 HT 3~ 276 pumps with a 120mm impeller each having a capacity of 12.6 L/s at 13.1 m TDH have been selected. The proposed pump will have a 4.2 kW 3/50/400 volt motor. A copy of the pump curve is included in Appendix "A". According to the MOE guidelines for sewage pump station pumps shall be capable of passing spheres of at least 62 mm diameter.

4.2.5 Overflow

An emergency overflow has been preliminarily sized at an elevation of 224.15. This elevation will be reviewed at detailed design to ensure that it is below the lowest basement slab in the Development. Details of the emergency outlet route will be further reviewed at the detailed design stage.

4.2.6 Forcemain

From the proposed pumping station, it is anticipated that the forcemain will tie into the existing sanitary manhole located at the intersection of Cambridge St. and Fuller Ave. where from here it will flow by gravity. With respect to the forcemain, the following nominal velocities would result from the pumped flow rate through various sizes of pipe:

Table 1 – Forcemain Velocities

Dia. (mm)	Area (m^2)	1 Pump		2 Pumps
		Q = 12.6 L/s	Q = 18.9 L/s	Q = 25.2 L/s
75	0.0044	2.85	4.28	5.70
100	0.0079	1.60	2.41	3.21
125	0.0123	1.03	1.54	2.05
150	0.0177	0.71	1.07	1.43

The MOE Guidelines suggest a velocity range in the low end of 0.8 to 3.0 m/s. Based on this, it is recommended that a 125mm diameter forcemain would be utilized. The forcemain is proposed to be HDPE DR 11 with a pressure rating of 1103 kPa (160 psi). No air release valves are proposed as the route selected does not experience any significant or abrupt grade changes.

4.3 Ventilation

Ventilation for the Sewage Pumping Station Maintenance Hole will be provided by two (2) 100mm diameter bird screen gooseneck vents, one terminating at the underside of the structure lid, and one terminating 300mm above the sanitary inlet obvert. The ducting will be made of stainless steel.

All of which is respectfully submitted,

GERRITS ENGINEERING

Project
ST. ANDREWS LAKE VILLAGE

Drawing:
SEWAGE PUMPING STATION

Project No. 228-008	Designed by: PMD	Checked by: JDM	
Scale: AS SHOWN	Drawn by: PMD	Approved by: JDM	
Orientation	Stamp		

Drawing No.
SPS-1

q = average daily per capita flow (450 L/cap.d)
I = unit of peak estraneous flow (0.1 L/ha.s)
M = peaking factor
Q(p) = peak Popukation flow (L/s)
Q(i) = peak extraneous flow (L/s)
Q(d) = peak design flow

Appendix C

Supporting Stormwater Design Information and Calculations

Weighted Curve Number Calculator

Input:

Catchment ID	101		
Hydrologic Soil Group	A		
Soil Texture	Tioga	Weighted Curve Number	Weighted Runoff 'C'
Wetland(ha)/CN	0.000	N/A	N/A
Woods(ha)/CN	1.771	32.0	0.12
Pasture/Lawn Area(ha)/CN	0.453	49.0	0.15
Cultivated(ha)/CN	0.000	N/A	N/A
Impervious Area(ha)/CN	0.040	100.0	0.95

Calculated:

Area	2.264
Average CN	37
Average Pervious CN	35
Average Runoff 'C'	0.14

Initial Abstraction Calculator

Input:

Wetland	16	mm
Woods	10	mm
Pasture/Lawns	5	mm
Cultivated	7	mm
Impervious Areas	2	mm

Calculated:

Total Average IA	8.86	mm
Average Pervious IA	8.98	mm

*Weighted Curve Numbers and Weighted Rational Coefficients are determined from the weighted average of the area and Curve Number or Rational Coefficient in a given soil type, i.e. Type A, B, C or D.

Time of Concentration Calculator

Input:

Catchment Max El.	N/A	m
Catchment Min. El.	N/A	m
Catchment Flow Length	160	m

Calculated:

Catchment Ave. Slope	6.00	%
Imperviousness	1.77%	
Directly Connected Imperviousness	0.00%	

Calculated: RATIONAL COEFFICIENT

5YR Rational 'C'	0.14

Calculated: MTO DRAINAGE MANUAL

25YR Rational 'C'	0.15
50YR Rational 'C'	0.17
100YR Rational 'C'	0.18

Calculated: AIRPORT METHOD (Runoff Coef <0.4)

Time of Concentration	21.90	min
Time of Concentration	0.37	hr
Time to Peak	0.24	hr

$Tc=3.26*(1.1-C)*L^{0.5}*S^{-0.33}$

Calculated: BRANSBY-WILLIAMS METHOD (Runoff Coef >=0.4)

Time of Concentration	5.87	min
Time of Concentration	0.10	hr
Time to Peak	0.07	hr

$Tc=0.057*L*S^{-0.2}*A^{-0.1}$

Use:

Time of Concentration	**0.37**	**hr**
Time to Peak	**0.24**	**hr**

Cultivated(ha)/CN	0.000	N/A	N/A
Impervious Area(ha)/CN	0.000	N/A	N/A

Calculated:

Area	0.905
Average CN	32
Average Pervious CN	32
Average Runoff 'C'	0.08

Initial Abstraction Calculator

Input:

Wetland	16	mm
Woods	10	mm
Pasture/Lawns	5	mm
Cultivated	7	mm
Impervious Areas	2	mm

Calculated:

Total Average IA	10.00	mm
Average Pervious IA	10.00	mm

*Weighted Curve Numbers and Weighted Rational Coefficients are determined from the weighted average of the area and Curve Number or Rational Coefficient in a given soil type, i.e. Type A, B, C or D.

Time of Concentration Calculator

Input:

Catchment Max El.	N/A	m
Catchment Min. El.	N/A	m
Catchment Flow Length	30	m

Calculated:

Catchment Ave. Slope	5.00	%
Imperviousness	0.00%	
Directly Connected Imperviousness	0.00%	

Calculated: RATIONAL COEFFICIENT

5YR Rational 'C'	0.08

Calculated: MTO DRAINAGE MANUAL

25YR Rational 'C'	0.09
50YR Rational 'C'	0.10
100YR Rational 'C'	0.10

Calculated: AIRPORT METHOD (Runoff Coef <0.4)

Time of Concentration	10.71	min
Time of Concentration	0.18	hr
Time to Peak	0.12	hr

$Tc=3.26*(1.1-C)*L^{0.5}*S^{-0.33}$

Calculated: BRANSBY-WILLIAMS METHOD (Runoff Coef >=0.4)

Time of Concentration	1.25	min
Time of Concentration	0.02	hr
Time to Peak	0.01	hr

$Tc=0.057*L*S^{-0.2}*A^{-0.1}$

Use:

Time of Concentration	**0.18**	**hr**
Time to Peak	**0.12**	**hr**

Stormwater Treatment Recommendation

The recommended Stormceptor Model(s) which achieve or exceed the user defined water quality objective for each site within the project are listed in the below Sizing Summary table.

Site Name	South Pond OGS Unit
Recommended Stormceptor Model	STC 6000
Target TSS Removal (%)	80.0
TSS Removal (%) Provided	80
PSD	Fine Distribution
Rainfall Station	ORILLIA TS

The recommended Stormceptor model achieves the water quality objectives based on the selected inputs, historical rainfall records and selected particle size distribution.

Stormceptor Sizing Summary		
Stormceptor Model	**% TSS Removal Provided**	**% Runoff Volume Captured Provided**
STC 300	50	55
STC 750	63	73
STC 1000	64	73
STC 1500	65	73
STC 2000	70	83
STC 3000	71	83
STC 4000	76	91
STC 5000	77	91
STC 6000	80	94
STC 9000	84	97
STC 10000	84	97
STC 14000	87	98
StormceptorMAX	Custom	Custom

Stormceptor
The Stormceptor oil and sediment separator is sized to treat stormwater runoff by removing pollutants through gravity separation and flotation. Stormceptor's patented design generates positive TSS removal for each rainfall event, including large storms. Significant levels of pollutants such as heavy metals, free oils and nutrients are prevented from entering natural water resources and the re-suspension of previously captured sediment (scour) does not occur.
Stormceptor provides a high level of TSS removal for small frequent storm events that represent the majority of annual rainfall volume and pollutant load. Positive treatment continues for large infrequent events, however, such events have little impact on the average annual TSS removal as they represent a small percentage of the total runoff volume and pollutant load.

Design Methodology
Stormceptor is sized using PCSWMM for Stormceptor, a continuous simulation model based on US EPA SWMM. The program calculates hydrology using local historical rainfall data and specified site parameters. With US EPA SWMM's precision, every Stormceptor unit is designed to achieve a defined water quality objective. The TSS removal data presented follows US EPA guidelines to reduce the average annual TSS load. The Stormceptor's unit process for TSS removal is settling. The settling model calculates TSS removal by analyzing:
• Site parameters
• Continuous historical rainfall data, including duration, distribution, peaks & inter-event dry periods
• Particle size distribution, and associated settling velocities (Stokes Law, corrected for drag)
• TSS load
• Detention time of the system

Hydrology Analysis
PCSWMM for Stormceptor calculates annual hydrology with the US EPA SWMM and local continuous historical rainfall data. Performance calculations of Stormceptor are based on the average annual removal of TSS for the selected site parameters. The Stormceptor is engineered to capture sediment particles by treating the required average annual runoff volume, ensuring positive removal efficiency is maintained during each rainfall event, and preventing negative removal efficiency (scour). Smaller recurring storms account for the majority of rainfall events and average annual runoff volume, as observed in the historical rainfall data analyses presented in this section.

Rainfall Station			
State/Province	Ontario	**Total Number of Rainfall Events**	2670
Rainfall Station Name	ORILLIA TS	**Total Rainfall (mm)**	13591.3
Station ID #	5820	**Average Annual Rainfall (mm)**	485.4
Coordinates	44°23'N, 79°25'W	**Total Evaporation (mm)**	878.3
Elevation (ft)	720	**Total Infiltration (mm)**	4738.5
Years of Rainfall Data	28	**Total Rainfall that is Runoff (mm)**	7974.5

Notes
• Stormceptor performance estimates are based on simulations using PCSWMM for Stormceptor, which uses the EPA Rainfall and Runoff modules. • Design estimates listed are only representative of specific project requirements based on total suspended solids (TSS) removal defined by the selected PSD, and based on stable site conditions only, after construction is completed. • For submerged applications or sites specific to spill control, please contact your local Stormceptor representative for further design assistance.

ORIFICE CONTROLS

Orifice No. 1

- Orifice diameter (m)	0.050
- Area (m^2)	0.001963
- Orifice C	0.63
- Invert (m)	225.90

Submerged Orifice Equation (Flow Above Orifice Centroid):
$Q = CxAx(2gH)^{0.5}$

where;
Q = flow rate (m^3/s)
C = constant
A = area of opening(m^2)
H = net head on the orifice
g = Acceleration due to gravity
D=orifice diameter (m)

WEIR CONTROL

Overflow Weir

- Length of Weir(m)	2	
- Weir Sill(m)	227.65	
- Downstream Length of 'Overflow' Weir (m)	7.35	@227.65m
- Weir Side Slopes (H:V)	10	
- Acces Road Width	3.5	

- Weir Equation: Broad Crested Weir $Q = (C\ L\ (H3/2)) + (C(H5/2)Tan(\alpha/2))$

where ; Q = flow rate (m^3/s)
C = constant (refer to Triangular and Rectangular 'C' Equations below)
L = length (m)
H = head on the weir (m)
α = angle at apex of triangle (radians)
x = head divided by downstream Length of Weir (H/l)

Triangular 'C' Equation
$C=(a+bx)/(1+cx+dx^2)$

a	-1E-05
b	143.5987
c	114.5047
d	-4.76857

Rectangular 'C' Equation
$C=(a+bx)/(1+cx+dx^2)$

a	-10383.5
b	3418997
c	2131595
d	-235014
